Computer Algebra, June 26-28, 2023

## Differential ring

## Definition

A differential ring $\left(R,{ }^{\prime}\right)$ is a commutative ring with a derivation ${ }^{\prime}: R \rightarrow R$, that is, a map such that, for all $a, b \in R,(a+b)^{\prime}=a^{\prime}+b^{\prime}$ and $(a b)^{\prime}=a^{\prime} b+a b^{\prime}$. A differential field is a differential ring that is a field. For $i>0, a^{(i)}$ denotes the $i$-th order derivative of $a \in R$.

Let $x$ be an element of a differential ring. We introduce $x^{(\infty)}:=\left(x, x^{\prime}, x^{\prime \prime}, x^{(3)}, \ldots\right)$.

## Ring of differential polynomials

## Definition

Let $R$ be a differential ring. Consider a ring of polynomials in infinitely many variables

$$
R\left[x^{(\infty)}\right]:=R\left[x, x^{\prime}, x^{\prime \prime}, x^{(3)}, \ldots\right]
$$

and extend the derivation from $R$ to this ring by $\left(x^{(j)}\right)^{\prime}:=x^{(j+1)}$. The resulting differential ring is called the ring of differential polynomials in $x$ over $R$.

The ring of differential polynomials in several variables is defined by iterating this construction.

## Differential ideal

## Definition

Let $S:=R\left[x_{1}^{(\infty)}, \ldots, x_{n}^{(\infty)}\right]$ be a ring of differential polynomials over a differential ring $R$. An ideal $I \subset S$ is called a differential ideal if $a^{\prime} \in I$ for every $a \in I$.

One can verify that, for every $f_{1}, \ldots, f_{s} \in S$

$$
\left\langle f_{1}^{(\infty)}, \ldots, f_{s}^{(\infty)}\right\rangle
$$

is a differential ideal. Moreover, this is the minimal differential ideal containing $f_{1}, \ldots, f_{s}$, and we will denote it by $\left\langle f_{1}, \ldots, f_{s}\right\rangle(\infty)$.

## Differential ideal

## Definition

Let $I$ be an ideal in ring $R$, and $a \in R$. Then

$$
I: a^{\infty}:=\left\{b \in R \mid \exists N: a^{N} b \in I\right\} .
$$

Note that the resulting set $I: a^{\infty}$ is also an ideal in $R$. And if $I$ is a differential ideal, than set $I: a^{\infty}$ is also a differential ideal.

## The order of differential polynomial

## Definition

For every $1 \leq i \leq n$, we will call the largest $j$ such that $x_{i}^{(j)}$ appears in $P$ the order of $P$ respect to $x_{i}$ and denote it by ord ${ }_{x_{i}} P$; if $P$ does not involve $x_{i}$, we set $\operatorname{ord}_{x_{i}} P:=-1$.

## The order of differential polynomial

## Definition

For every $1 \leq i \leq n$, we will call the largest $j$ such that $x_{i}^{(j)}$ appears in $P$ the order of $P$ respect to $x_{i}$ and denote it by ord ${ }_{x_{i}} P$; if $P$ does not involve $x_{i}$, we set $\operatorname{ord}_{x_{i}} P:=-1$.

## Example

For differential polynomial

$$
P=\left(x^{\prime}\right)^{2}-4 x^{3}+x
$$

we have

$$
\operatorname{ord}_{x} P=1, \frac{\partial P}{\partial x^{\prime}}=2 x^{\prime}
$$

## Problem

Consider a system of differential equations of the form

$$
\begin{equation*}
x^{\prime}=\boldsymbol{f}(x), \tag{1}
\end{equation*}
$$

where $\mathbf{x}=\left(x_{1}, \ldots, x_{n}\right)$ is a tuple of differential indeterminates and $\mathbf{f}=\left(f_{1}, \ldots, f_{n}\right)$ is a tuple of polynomials from $\mathbb{C}[\mathbf{x}]$.
One natural elimination task is to eliminate all the variables in the system (1) except one, say $x_{1}$, that is, describe a differential ideal

$$
\begin{equation*}
\left\langle x_{1}^{\prime}-f_{1}(\boldsymbol{x}), \ldots, x_{n}^{\prime}-f_{n}(\boldsymbol{x})\right\rangle^{(\infty)} \cap \mathbb{C}\left[x_{1}^{(\infty)}\right] . \tag{2}
\end{equation*}
$$

## Problem

The ideal (2) is uniquely determined by its minimal polynomial $f_{\text {min }}$ (polynomials are compared first w.r.t. the order and then w.r.t. total degree)

$$
i_{1}>i_{2} \Rightarrow x_{1}^{\left(i_{1}\right)}>x_{1}^{\left(i_{2}\right)}
$$

We can define ideal (2) as

$$
I=\left\langle f_{\min }\right\rangle^{(\infty)}: H^{(\infty)},
$$

with

$$
H=\frac{\partial f_{\min }}{\partial x_{1}^{(h)}} \text { and } h=\operatorname{ord}_{x_{1}} f_{\min } .
$$

## Toy example

Consider the following model:

$$
\left\{\begin{array}{l}
x_{1}^{\prime}=x_{2}^{2} \\
x_{2}^{\prime}=x_{2}
\end{array}\right.
$$

## Toy example

Consider the following model:

$$
\left\{\begin{array}{l}
x_{1}^{\prime}=x_{2}^{2} \\
x_{2}^{\prime}=x_{2}
\end{array}\right.
$$

Then

$$
x_{1}^{\prime \prime}=2 x_{2} x_{2}^{\prime}=2 x_{2}^{2}=2 x_{1}^{\prime} .
$$

## Toy example

Consider the following model:

$$
\left\{\begin{array}{l}
x_{1}^{\prime}=x_{2}^{2} \\
x_{2}^{\prime}=x_{2}
\end{array}\right.
$$

Then

$$
x_{1}^{\prime \prime}=2 x_{2} x_{2}^{\prime}=2 x_{2}^{2}=2 x_{1}^{\prime} .
$$

In this case,

$$
I=\left\langle x_{1}^{\prime}-x_{2}^{2}, x_{2}^{\prime}-x_{2}\right\rangle^{(\infty)} \cap \mathbb{C}\left[x_{1}^{(\infty)}\right] .
$$

is uniquely determined by

$$
f=2 x_{1}^{\prime}-x_{1}^{\prime \prime}
$$

## How it works

Consider the following model:

$$
\left\{\begin{array}{l}
x_{1}^{\prime}=x_{1}^{2}+x_{2}^{2}, \\
x_{2}^{\prime}=x_{2}+1
\end{array}\right.
$$

## How it works

Consider the following model:

$$
\left\{\begin{array}{l}
x_{1}^{\prime}=x_{1}^{2}+x_{2}^{2} \\
x_{2}^{\prime}=x_{2}+1
\end{array}\right.
$$

In this case,

$$
I=\left\langle x_{1}^{\prime}-x_{1}^{2}-x_{2}^{2}, x_{2}^{\prime}-x_{2}-1\right\rangle^{(\infty)} \cap \mathbb{C}\left[x_{1}^{(\infty)}\right]
$$

is uniquely determined by

$$
\begin{aligned}
f= & \left(x_{1}^{\prime \prime}\right)^{2}+4 x_{1}^{4}+4 x_{1}^{2}\left(x_{1}^{\prime}\right)^{2}+4 x_{1}^{2}+4\left(x_{1}^{\prime}\right)^{2}-8 x_{1}^{2} x_{1}^{\prime}-4 x_{1} x_{1}^{\prime} x_{1}^{\prime \prime}-4\left(x_{1}^{\prime}-x_{1}^{2}\right) x_{1}^{\prime \prime}+ \\
& +8 x_{1} x_{1}^{\prime}\left(x_{1}^{\prime}-x_{1}^{2}\right)-4 x_{1}^{\prime} .
\end{aligned}
$$

## Motivation

Describe/compute the minimal polynomial of the elimination ideal $\rightarrow$
$\rightarrow$ find the support of the minimal polynomial

## Motivation

Describe/compute the minimal polynomial of the elimination ideal $\rightarrow$
$\rightarrow$ find the support of the minimal polynomial
$\triangleright$ finding truncated power series solutions of $\mathbf{x}^{\prime}=\mathbf{g}(\mathbf{x})$

## Problem

Consider the case of system

$$
\left\{\begin{array}{l}
x_{1}^{\prime}=g_{1}\left(x_{1}, x_{2}\right) \\
x_{2}^{\prime}=g_{2}\left(x_{1}, x_{2}\right)
\end{array}\right.
$$

where $g_{1}, g_{2}=$ generic polynomials of degrees $d_{1}$ and $d_{2}$.

## Small step for a man

## Theorem

Consider the system

$$
\left\{\begin{array}{l}
x_{1}^{\prime}=g_{1}\left(x_{1}, x_{2}\right), \\
x_{2}^{\prime}=g_{2}\left(x_{1}, x_{2}\right),
\end{array}\right.
$$

where $g_{1}, g_{2}=$ generic polynomials of degrees 2 and $d$. Then the Newton polytope of the minimal polynomial in $\left(s_{0}, s_{1}, s_{2}\right)$-coordinates $\left(x_{1}^{s_{0}}\left(x_{1}^{\prime}\right)^{s_{1}}\left(x_{1}^{\prime \prime}\right)^{s_{2}}\right)$ is
(1) a pyramid with vertices $(0,0,0),(4,0,0),(2,2,0),(0,3,0),(0,0,2)$ if $d=1$,
(3) a tetrahedron with vertices $(0,0,0),(2(d+1), 0,0),(0, d+1,0),(0,0,2)$ if $d \geq 2$.

## Newton polytope of the minimal polynomial

Figure: $(2,1)$ case

Figure: $(2, d), d \geq 2$ case

## General case

## Theorem

Consider the system

$$
\left\{\begin{array}{l}
x_{1}^{\prime}=g_{1}\left(x_{1}, x_{2}\right), \\
x_{2}^{\prime}=g_{2}\left(x_{1}, x_{2}\right),
\end{array}\right.
$$

where $g_{1}, g_{2}=$ generic polynomials of degrees $d_{1}$ and $d_{2}$. Then the Newton polytope of the minimal polynomial in $\left(s_{0}, s_{1}, s_{2}\right)$-coordinates $\left(x_{1}^{s_{0}}\left(x_{1}^{\prime}\right)^{s_{1}}\left(x_{1}^{\prime \prime}\right)^{s_{2}}\right)$ is
(1) a pyramid with vertices
$(0,0,0),\left(d_{1}\left(d_{1}+d_{2}-1\right), 0,0\right),\left(d_{1}\left(d_{1}-1\right), d_{1}, 0\right),\left(0,2 d_{1}-1,0\right),\left(0,0, d_{1}\right)$ if $d_{1}>d_{2}$,
© a tetrahedron with vertices

$$
(0,0,0),\left(d_{1}\left(d_{1}+d_{2}-1\right), 0,0\right),\left(0, d_{1}+d_{2}-1,0\right),\left(0,0, d_{1}\right) \text { if } d_{1} \leq d_{2} .
$$

$d_{1} \leq d_{2}$ case

## Proof plan

(1) ord $f_{\min }=2$.
(2) $f_{3}=\left(f_{1}\right)^{\prime}=0 \rightarrow$

$$
\left\{\begin{array}{l}
f_{1}=x_{1}^{\prime}-g_{1}\left(x_{1}, x_{2}\right),  \tag{3}\\
f_{3}=x_{1}^{\prime \prime}-x_{1}^{\prime} \frac{\partial}{\partial x_{1}} g_{1}\left(x_{1}, x_{2}\right)-g_{2}\left(x_{1}, x_{2}\right) \frac{\partial}{\partial x_{2}} g_{1}\left(x_{1}, x_{2}\right) .
\end{array}\right.
$$

(3) $\operatorname{Res}_{x_{2}}\left(f_{1}, f_{3}\right)=\left(f_{\text {min }}\right)^{n}, n \in \mathbb{N}$
(1) $\operatorname{Res}_{x_{2}}\left(f_{1}, f_{3}\right)$ is irreducible $+\operatorname{deg} \operatorname{Res}_{x_{2}}\left(f_{1}, f_{3}\right)=d \Rightarrow$
$\Rightarrow$ for $\left(x_{1}\right)^{s_{0}}\left(x_{1}^{\prime}\right)^{s_{1}}\left(x_{1}^{\prime \prime}\right)^{s_{2}}$ in $\operatorname{Res}_{x_{2}}\left(f_{1}, f_{3}\right)$

$$
s_{0}+s_{1}+s_{2} \leq d
$$

## $(1, d)$ case

Consider the system

$$
\left\{\begin{array}{l}
x_{1}^{\prime}=g_{1}\left(x_{1}, x_{2}\right)=c_{1} x_{1}+c_{2} x_{2}+c_{3}, c_{2} \neq 0 \\
x_{2}^{\prime}=g_{2}\left(x_{1}, x_{2}\right)
\end{array}\right.
$$

where $g_{1}, g_{2}=$ polynomials of degrees 1 and $d$. In this case

$$
x_{1}^{\prime \prime}=c_{1} x_{1}^{\prime}+c_{2} x_{2}^{\prime} .
$$

Consider new system

$$
\left\{\begin{array}{l}
f_{1}=x_{1}^{\prime}-c_{1} x_{1}-c_{2} x_{2}-c_{3}, \\
f_{3}=x_{1}^{\prime \prime}-c_{1} x_{1}^{\prime}-c_{2} g_{2}\left(x_{1}, x_{2}\right)
\end{array}\right.
$$

Compute the resultant of polynomials $f_{1}$ and $f_{3}$ to eliminate $x_{2}$.

$$
\operatorname{Res}_{x_{2}}\left(f_{1}, f_{3}\right)=x_{1}^{\prime \prime}-c_{1} x_{1}^{\prime}-c_{2} g_{2}\left(x_{1}, \frac{1}{c_{2}}\left(x_{1}^{\prime}-c_{1} x_{1}-c_{3}\right)\right) .
$$

## $(1, d)$ case

In this case
(1) $\operatorname{Res}_{x_{2}}\left(f_{1}, f_{3}\right)=f_{\text {min }}$.
(c) $\operatorname{deg} \operatorname{Res}_{x_{2}}\left(f_{1}, f_{3}\right)=d \Rightarrow$ for $\left(x_{1}\right)^{s_{0}}\left(x_{1}^{\prime}\right)^{s_{1}}\left(x_{1}^{\prime \prime}\right)^{s_{2}}$ in $\operatorname{Res}_{x_{2}}\left(f_{1}, f_{3}\right)$ we have

$$
s_{0}+s_{1}+s_{2} \leq d
$$

(3) $\operatorname{Res}_{x_{2}}\left(f_{1}, f_{3}\right)$ contains $x_{1}^{\prime \prime},\left(x_{1}^{\prime}\right)^{d}$ и $\left(x_{1}\right)^{d}$.

## $(1, d)$ case

Then the Newton polytope of the minimal polynomial in ( $s_{0}, s_{1}, s_{2}$ )-coordinates $\left(x_{1}^{s_{0}}\left(x_{1}^{\prime}\right)^{s_{1}}\left(x_{1}^{\prime \prime}\right)^{s_{2}}\right)$ is a tetrahedron with vertices

$$
(0,0,0),(d, 0,0),(0, d, 0),(0,0,1)
$$

Figure: Newton polytope of the minimal polynomial for $(1, d)$ case.
